

# Parallel Key Verification

Sample document with complete example values. It shows the report the purchased export produces for YOUR input - it is not itself a report for any part.

Project: Sample project

Part/Position: no real part

Prepared by: Sample, not released

Key A 12x8x80, d = 40 mm

Overall assessment: OK (bearing pressure verification at shaft and hub satisfied)

## Inputs

|                           |                       |
|---------------------------|-----------------------|
| Shaft diameter d          | 40 mm                 |
| Nominal torque T          | 500 Nm                |
| Application factor K_A    | 1                     |
| Number of keys i          | 1                     |
| Key form                  | A                     |
| Key length l              | 80 mm                 |
| Shaft strength (Re or Rm) | 490 N/mm <sup>2</sup> |
| Hub strength (Re or Rm)   | 295 N/mm <sup>2</sup> |
| Key strength              | 430 N/mm <sup>2</sup> |

## Key per DIN 6885-1 (high form)

|                        |           |
|------------------------|-----------|
| Cross-section b x h    | 12 x 8 mm |
| Keyway depth, shaft t1 | 5 mm      |
| Keyway depth, hub t2   | 3.3 mm    |

## Results

| Quantity                                            | Value                  |
|-----------------------------------------------------|------------------------|
| Equivalent torque K_A·T                             | 500 Nm                 |
| Circumferential force F_u                           | 25,000 N               |
| Load-bearing fraction $\phi$                        | 1                      |
| Load-carrying length l_tr                           | 68 mm                  |
| Shear stress in the key cross-section (informative) | 30.6 N/mm <sup>2</sup> |

## Bearing pressure verification

| Criterion                                        | Value                   | Limit                   | Status |
|--------------------------------------------------|-------------------------|-------------------------|--------|
| Bearing pressure, shaft $p \leq p_{\text{perm}}$ | 73.5 N/mm <sup>2</sup>  | 387 N/mm <sup>2</sup>   | ● OK   |
| Bearing pressure, hub $p \leq p_{\text{perm}}$   | 122.5 N/mm <sup>2</sup> | 265.5 N/mm <sup>2</sup> | ● OK   |

## Bearing pressure utilization

## Required minimum length

|                                            |         |
|--------------------------------------------|---------|
| Required load-carrying length $l_{tr,req}$ | 31.4 mm |
| Required total length $l_{req}$            | 43.4 mm |
| Smallest suitable standard length          | 45 mm   |

## Notes

Effective length above  $1.3 \cdot d$ : the additional length hardly increases the capacity because of the uneven load distribution.

## Calculation basis

Bearing pressure verification per DIN 6892 (simplified method C) with key geometry per DIN 6885-1, high form. The circumferential force from the equivalent torque  $K_A \cdot T$  is reacted through the load-carrying keyway flanks; the bearing pressure is verified at the shaft (load-carrying height  $t_1$ ) and hub (load-carrying height  $h - t_1$ ) against  $0.9 \cdot Re$  of the weaker contact partner in each case. With two keys, a load-bearing fraction of 0.75 is assumed. The required length results from the governing (weaker) contact.

## About this sample

All values on these pages come from a freely chosen example calculation and belong to no real part. The purchased export contains the same sections with your input, your header data (project, part, prepared by) and as searchable text. Pricing and scope: [maschinenbaurechner.de/en/pricing](https://maschinenbaurechner.de/en/pricing)

Note: The results are design and orientation aids. They do not replace independent verification, calculation and approval by a qualified person. The terms of use at [maschinenbaurechner.de](https://maschinenbaurechner.de) apply.
